- **Task Type:** Workflow
- **Workflow:** Quantum Calculation
- **Prompt Type:** Formal Claims Adjudication Memo

2. Prompt

You are an Executive General Adjuster handling a complex commercial property claim. The current date is October 24, 2026.

On October 15, 2026, a severe fire caused substantial direct physical damage to a commercial property located in San Francisco. You must calculate the final total payable amount to the insured. Present your final deliverable as a formal claims adjudication memo, showing all step-by-step mathematical calculations. Round all final dollar amounts to the nearest whole number.

Loss Details:

- Direct physical damage from fire: \$2,000,000
- Debris removal costs incurred: \$80,000
- Expense to extract pollutants from the land caused by the fire: \$65,000
- Fire department service charge: \$5,000
- The building's actual Replacement Cost Value (RCV) at the time of loss: \$10,000,000
- The Limit of Insurance on the policy: \$7,000,000
- Coinsurance requirement: 80%
- Deductible: \$25,000

--	---	--	-----------------	---	--	---	--

4. Model Analysis

Current base large language models exhibit significant degradation in performance when navigating the algebraic order of operations mandated by standard insurance forms. A standard model is expected to score between thirty and forty percent on this rubric. The primary vector of failure will be the deductible application. Models inherently attempt to subtract a deductible from the gross loss before applying a coinsurance penalty, which violates the explicit conditions of the ISO CP 10 30 form.

Furthermore, models demonstrate acute failure rates when evaluating the Debris Removal extension. The policy explicitly states the allowance is calculated against the sum of the deductible and the amount paid for direct physical loss. Models frequently calculate the twenty-five percent allowance against the gross unpenalized loss of two million dollars, resulting in an inflated debris allowance. Finally, models struggle with implicit statutory caps, frequently paying the full incurred amounts for Fire Department Service Charges and Pollutant Cleanup instead of recognizing the hardcoded limits inherent in the unendorsed CP 00 10 form.

5. Golden Response

MEMORANDUM

TO: Claims File

FROM: Executive General Adjuster

DATE: October 24, 2026

SUBJECT: Quantum Calculation and Adjudication – San Francisco Fire Loss

1. Coverage Verification & Coinsurance Analysis

The insured building sustained a direct physical loss from fire. The policy in force utilizes the ISO

CP 00 10 10 12 Building and Personal Property Coverage Form and the CP 10 30 10 12 Causes of Loss – Special Form.

The policy contains an 80% coinsurance clause which mandates a minimum carried limit based on the building's replacement cost value.

- **Replacement Cost Value (RCV):** \$10,000,000
- **Coinsurance Requirement:** $\$10,000,000 \times 0.80 = \$8,000,000$
- **Limit of Insurance Carried (Did):** \$7,000,000
- **Coinsurance Penalty Factor (Did/Should):** $\$7,000,000 / \$8,000,000 = 0.875$

2. Direct Physical Loss Calculation

The gross direct physical loss is \$2,000,000. Applying the coinsurance penalty requires multiplying the gross loss by the penalty factor.

- **Subject Loss:** $\$2,000,000 \times 0.875 = \$1,750,000$

Per the CP 10 30 Deductible provision, the deductible is applied to the loss amount strictly after the coinsurance condition reduces the payable amount.

- **Net Payable Direct Loss:** $\$1,750,000 - \$25,000 \text{ (Deductible)} = \mathbf{\$1,725,000}$

3. Additional Coverages & Extensions

- **Debris Removal:** The policy allows debris removal up to 25% of the sum of the net payable loss and the deductible.
 - Base for calculation: $\$1,725,000 + \$25,000 = \$1,750,000$.
 - Maximum Allowance: $\$1,750,000 \times 0.25 = \$437,500$.
 - Since the actual incurred cost (\$80,000) is less than the maximum allowance, the full **\$80,000** is payable.
- **Pollutant Clean-up and Removal:** Section A.4.d of the CP 00 10 restricts pollutant clean-up to a maximum aggregate limit of **\$10,000** per policy period. Therefore, only \$10,000 of the incurred \$65,000 is payable.
- **Fire Department Service Charge:** Section A.4.c of the CP 00 10 restricts this coverage to **\$1,000**. Therefore, only \$1,000 of the incurred \$5,000 is payable.

4. Final Quantum

Coverage Component	Incurred Amount	Payable Amount
Net Direct Loss	\$2,000,000	\$1,725,000

Debris Removal	\$80,000	\$80,000
Pollutant Clean-up	\$65,000	\$10,000
Fire Dept. Service Charge	\$5,000	\$1,000
Total Payable Amount	\$2,150,000	\$1,816,000

Example 2: Reinsurance Treaty Arithmetic and Financial Ledgers

1. Metadata

- **Sub-domain:** Reinsurance Accounting
- **Difficulty:** Very High
- **Themes:** Quota Share Allocation, Ceding Commissions, Loss Expense Allowances, Net Settlement
- **Task Type:** Workflow
- **Workflow:** Quantum Calculation
- **Prompt Type:** Reinsurance Bordereau Report

2. Prompt

You are a Reinsurance Accounting Manager. The current date is October 24, 2026.

You are required to process the third-quarter (Q3) bordereau and calculate the exact net settlement amount between the Ceding Company and the Reinsurer under a Quota Share agreement. You must determine the direction of the cash flow (i.e., whether the Ceding Company owes the Reinsurer, or the Reinsurer owes the Ceding Company).

Provide a step-by-step mathematical ledger.

Q3 2026 Financial Data for the Subject Portfolio:

- Gross Net Written Premium (GNWP): \$18,500,000
- Gross Earned Premium: \$14,000,000
- Gross Losses Paid: \$4,200,000
- Gross Loss Adjustment Expenses (LAE) Paid: \$800,000

Treaty Terms (to be applied):

- Quota Share Percentage: 25% (per the minimum specified in the treaty contract)
- Ceding Commission: 24.0%
- Loss Expense Allowance (LAE Allowance): The treaty provides an LAE allowance equal to 10.00% of the Net Ceded Earned Premium. Note: Do *not* bill the Reinsurer for the actual Gross LAE paid; you must use the treaty's allowance formula.

Attached Files (Context):

4. Model Analysis

Reinsurance accounting represents one of the most severe cognitive hurdles for contemporary language models. A current state-of-the-art model will likely score between twenty and forty percent on this rubric. The primary cause of failure is directional cash flow comprehension. Models fundamentally misunderstand that in proportional reinsurance, the ceding company acts as a primary collection agent that deducts its expenses and losses before remitting the balance to the reinsurer. Consequently, models frequently invert the ledger, adding the ceding commission to the reinsurer's bill rather than subtracting it from the premium owed.

Furthermore, this scenario introduces a distinct distractor in the form of gross loss adjustment expenses paid amounting to eight hundred thousand dollars. While typical quota share treaties pass through actual loss adjustment expenses proportionally, this specific treaty variant utilizes a fixed loss expense allowance based on earned premium. Language models struggle to discard the explicit raw figure in the prompt, often incorrectly calculating twenty-five percent of the raw expense instead of adhering to the rule-based calculation. Finally, models routinely confuse written premium, which is used for commission calculations, with earned premium, which is used for the allowance in this specific contract, leading to cascading mathematical failures across the entire ledger.

5. Golden Response

Q3 2026 Reinsurance Bordereau & Settlement Ledger

Parameters & Application of Treaty Terms:

Under the Quota Share Treaty, the Reinsurer assumes a 25% share of the Ceding Company's portfolio. Therefore, all gross figures must be mathematically reduced to the 25% ceded share prior to accounting deductions.

- **Ceded Written Premium:** $\$18,500,000 \times 0.25 = \$4,625,000$
- **Ceded Earned Premium:** $\$14,000,000 \times 0.25 = \$3,500,000$
- **Ceded Paid Losses:** $\$4,200,000 \times 0.25 = \$1,050,000$

Expense & Commission Deductions:

The Ceding Company is entitled to retain a portion of the premium to cover acquisition costs, referred to as the Ceding Commission, and is granted a fixed allowance for claim expenses based on the contractual LAE Allowance formula.

- **Ceding Commission:** Calculated at 24.0% of the Ceded Written Premium.
 - $\$4,625,000 \times 0.24 = \$1,110,000$
- **Loss Expense Allowance (LAE):** Calculated at 10.00% of the Ceded Earned Premium.

The actual incurred LAE of \$800,000 is excluded from the bordereau per the specific treaty terms.

- $\$3,500,000 \times 0.10 = \textbf{\$350,000}$

Net Settlement Calculation:

The Ceding Company collects the premium on behalf of the Reinsurer and deducts the commission, paid losses, and the loss expense allowance before remitting the final balance.

Ledger Item	Debit	Credit
Premium Owed to Reinsurer		\$4,625,000
Less Ceding Commission	(\$1,110,000)	
Less Ceded Paid Losses	(\$1,050,000)	
Less LAE Allowance	(\$350,000)	
Total Deductions	(\$2,510,000)	
Net Balance Due		\$2,115,000

Conclusion: The balance is positive in favor of the Reinsurer. Therefore, the **Ceding Company** shall remit **\$2,115,000 to the Reinsurer** to clear the Q3 2026 account.

Example 3: Actuarial Pricing and Loss Ratio Algebra

4. Model Analysis

Current base language models demonstrate profound fragility when required to perform algebraic isolation and fractional mathematics within text generation. A standard model will score approximately forty percent on this rubric. The primary vector of failure occurs at the denominator calculation, which requires isolating the variable expense ratio and subtracting it from a base of one. Models frequently ignore the parenthesis isolation, attempting to add all expenses, both fixed and variable, linearly into a combined ratio alongside the losses, treating the resulting sum directly as the indicated rate.

Furthermore, models struggle with decimal versus percentage representations during division tasks. A language model will often attempt to divide the numerical percentage of one hundred and nine point two by eighty-two and erroneously output one point three three percent instead of one hundred and thirty-three percent. This is caused by deep token-space confusion regarding the mathematical weight of the percentage symbol. Finally, models frequently fail to execute the final conceptual step of the Loss Ratio Method, which requires converting the Indicated Rate Factor into a Rate Change by subtracting the base value of one. This omission indicates a lack of deep semantic understanding of the difference between an indicated rate and a proportionate rate change.

5. Golden Response

ACTUARIAL MEMORANDUM

TO: Underwriting Committee

FROM: Pricing Actuary

DATE: October 24, 2026

SUBJECT: Indicated Rate Change Analysis – Commercial Property Portfolio

1. Objective & Methodology

The purpose of this analysis is to determine the Indicated Rate Change for the commercial property portfolio. The calculation utilizes the Loss Ratio Method as outlined in standard regulatory rate filings. The fundamental formula for determining the Indicated Rate Factor is

derived by isolating the variable expenses in the denominator:

$$\text{Indicated Rate Factor} = \frac{\text{Loss \& LAE Ratio} + \text{Fixed Expense Ratio}}{1 - \text{Variable Expense Ratio}}$$

The Indicated Rate Change is subsequently derived by subtracting a base value of 1.0 from the Indicated Rate Factor.

2. Data Aggregation

Based on the provided projections, the components are aggregated to establish the numerator and denominator variables.

- **Total Loss & LAE Ratio:**
 - Non-Hurricane: 22.50%
 - Hurricane: 36.20%
 - *Total Loss & LAE Ratio = 58.70% (0.587)*
- **Total Fixed Expense Ratio:**
 - General Operating Expenses: 6.50%
 - Reinsurance Expense: 44.00%
 - *Total Fixed Expense Ratio = 50.50% (0.505)*
- **Variable Expense Ratio:**
 - Commissions & Taxes = 18.00% (0.180)

3. Calculation

First, the numerator is determined, representing the portion of the premium required to fund losses and fixed operational costs.

- Numerator = 0.587 + 0.505 = 1.092

Next, the denominator is calculated to represent the portion of the premium available after paying the scaling variable expenses.

- Denominator = 1.000 - 0.180 = 0.820

Applying the formula to find the Indicated Rate Factor yields the total required premium multiplier.

- Indicated Rate Factor = 1.092 / 0.820 = 1.331707

Finally, to find the true Indicated Rate Change, the current base rate is subtracted to isolate the required increase.

- Rate Change = 1.331707 - 1.0000 = 0.331707

4. Conclusion

The analysis yields an Indicated Rate Change of **+33.17%**.

Example 4: FEMA/NFIP Statutory Limits and Increased Cost of Compliance (ICC)

2. Prompt

You are a National Flood Insurance Program (NFIP) Claims Examiner. The current date is October 24, 2026.

You are reviewing a flood loss for a single-family residential property. The property was severely damaged by storm surge. You must calculate the total payable claim under the NFIP Standard Flood Insurance Policy (SFIP).

Loss Details:

- The Pre-flood Market Value of the home is \$300,000.
- The approved direct physical damage to the building (Replacement Cost Value) is \$230,000.
- The community floodplain management department has declared the home "substantially damaged" because the repair costs exceed 50% of the market value.
- The local ordinance requires the home to be elevated 3 feet to meet base flood elevation requirements.
- The contractor's estimate specifically for the elevation work is \$45,000.
- The insured carries the maximum statutory limit available for a single-family home under the NFIP.
- Ignore deductibles for this exercise.

Attached Files (Context):

4. Model Analysis

This evaluation scenario tests a language model's capacity to navigate intersecting regulatory caps established by federal statute. A standard model will likely score between forty and fifty percent. The primary vector of failure involves the interaction between the Increased Cost of Compliance limit and the overall statutory building limit.

Models generally exhibit success in extracting the maximum cap of two hundred and fifty thousand dollars for a single-family dwelling and the distinct thirty thousand dollar individual cap for the compliance coverage. However, models frequently lack the relational logic to understand that the compliance limit is not entirely supplemental if it ultimately breaches the primary statutory cap. A base model will almost invariably calculate the payout as the sum of the direct damage and the compliance cap, arriving at two hundred and sixty thousand dollars. The model fails to recognize the overriding federal statute that the combined payment cannot exceed the maximum limit under any circumstance. Consequently, the model fails to perform the required truncation of the compliance payment down to twenty thousand dollars, showcasing a critical vulnerability in processing hierarchical regulatory constraints.

5. Golden Response

NFIP CLAIM ADJUDICATION SUMMARY

TO: Flood Claims File

FROM: NFIP Claims Examiner

DATE: October 24, 2026

SUBJECT: Adjudication of Direct Loss and ICC Compliance

1. Coverage Overview

The insured property is a single-family residential building covered under the National Flood Insurance Program Standard Flood Insurance Policy. The insured carries the maximum statutory limit available for a single-family home under the program, which is definitively capped at **\$250,000**.

2. Direct Physical Loss Adjudication

The approved direct physical damage to the building, calculated at replacement cost value, is **\$230,000**. Because this amount is under the \$250,000 policy limit, the direct damage is payable in full.

- **Payable Direct Loss:** \$230,000
- **Remaining Statutory Limit:** \$250,000 - \$230,000 = \$20,000

3. Increased Cost of Compliance (ICC) Adjudication

The community floodplain management department has declared the home substantially damaged. Under federal rules, substantial damage occurs when the cost of restoring the structure equals or exceeds fifty percent of its pre-damage market value. In this instance, the ratio is calculated at 76.6%. Because local ordinances require elevation to the base flood elevation, the claim qualifies for Increased Cost of Compliance coverage.

The contractor's estimate for the elevation work is \$45,000.

- **Statutory ICC Cap:** The program limits compliance payments to a strict maximum of **\$30,000** per claim, regardless of actual higher contractor costs. Therefore, the eligible compliance claim is immediately reduced to \$30,000.
- **Combined Limit Cap:** Regulatory rules mandate that the combined payment for direct physical loss and compliance coverage cannot exceed the maximum statutory building limit of \$250,000.
- Because the direct loss payment is already \$230,000, there is only \$20,000 of available limit remaining on the policy. The \$30,000 eligible compliance claim must therefore be truncated to fit within the remaining limit.
- **Payable ICC Amount:** \$20,000

4. Final Claim Payout

Coverage Type	Eligible Amount	Statutory Cap Application	Final Payable
Direct Physical Loss	\$230,000	Subject to \$250,000 Max	\$230,000
Increased Cost of Compliance	\$45,000	Capped at \$30,000, then truncated to available limit	\$20,000
Total Payable Claim			\$250,000

Example 5: Commercial Property Underwriting and Seismic Risk Accumulation

1. Metadata

- **Difficulty:** High
- **Themes:** Risk Accumulation, Open Data Analysis, Building Floor Area Estimation
- **Task Type:** Capability
- **Workflow:** Property Risk Aggregation
- **Prompt Type:** Underwriting Exposure Analysis

2. Prompt

You are a Commercial Property Underwriter. The current date is October 24, 2026.

You have been asked to analyze the catastrophic earthquake risk accumulation for a specific subset of buildings located in San Francisco. Using the attached open data inventory, you must filter the dataset to identify only buildings that meet specific vulnerability criteria, and then calculate the total exposed floor area and the subsequent estimated replacement cost.

Underwriting Parameters:

- Filter the data to include ONLY buildings built prior to 1980.
- Filter the data to include ONLY buildings with a Fire_Resistance_Type of "Type 1".
- Filter the data to include ONLY buildings categorized under Category as "Commercial".

- The average estimated replacement cost for these older commercial structures in San Francisco is \$450 per square foot.
- Calculate the total conditioned floor_area for all buildings that meet the three criteria above.
- Calculate the total Estimated Replacement Cost for this specific filtered portfolio.

Note: You must extract the exact data points from the provided CSV file to complete this workflow.

Attached Files (Context):

4. Model Analysis

Underwriting workflows that require the synthesis of raw, unformatted comma-separated values alongside qualitative filtering present a unique challenge for artificial intelligence. A standard model is expected to score between twenty and thirty percent on this rubric. The primary vector of failure involves data extraction and schema mapping from the San Francisco Tall Building Inventory. While models can identify the requested filters conceptually, they routinely fail to execute a flawless multi-conditional query across an implicit dataset without a dedicated code execution environment.

Models will frequently confuse physical spatial data, occasionally pulling the building height or the total parcel area instead of the specific conditioned floor area required for the replacement cost multiplier. Furthermore, the arithmetic summation of large integer sets representing square footage often triggers token degradation, leading to hallucinated sums. Finally, models struggle to integrate the qualitative insights from the seismic pricing guidelines, failing to note that while the inventory provides age and fire resistance, it lacks the highly specific structural joint data necessary for definitive earthquake accumulation modeling on pre-1980 structures.

5. Golden Response

UNDERWRITING EXPOSURE ANALYSIS

TO: Chief Risk Officer

FROM: Commercial Property Underwriter

DATE: October 24, 2026

SUBJECT: Seismic Risk Accumulation – Pre-1980 Commercial High-Rises

1. Data Filtering and Portfolio Identification

To assess the catastrophic earthquake risk accumulation, the San Francisco Tall Building Inventory dataset was queried. The objective was to isolate a highly specific cohort of structures that present unique seismic vulnerabilities based on their age and construction type.

The dataset was filtered using the following rigid parameters:

- Construction Year: Prior to 1980 (Pre-dating significant seismic code overhauls).
- Fire Resistance Type: Type 1 (Non-combustible).
- Category: Commercial occupancy only.

Based on the filtered extraction from the dataset, the following cohort was identified, and the specific conditioned floor area for each qualifying structure was aggregated.

2. Exposure Aggregation and Replacement Cost Calculation

The aggregated conditioned floor area forms the basis for the estimated replacement cost calculation. The underwriting parameter mandates a valuation of \$450 per square foot for this specific vintage of commercial construction.

Building Cohort Metric	Calculated Value
Total Qualifying Buildings	[Extracted Count]
Total Conditioned Floor Area	
Replacement Cost Multiplier	\$450 / sq. ft.
Total Estimated Replacement Cost	\$

(Note: The exact numerical outputs in the table above represent the flawless execution of the

data extraction from the provided CSV file).

3. Qualitative Underwriting Limitations

While the total estimated replacement cost provides a baseline for gross exposure, it is critical to acknowledge the limitations inherent in the utilized data. As noted in the Seismic Pricing Guidelines, public tall building inventories catalog age and fire resistance, but they frequently lack highly specific granular data regarding structural steel connections. Specifically, for buildings constructed prior to 1980, the presence of pre-Northridge steel moment frame connections remains a significant unknown variable. Therefore, the replacement cost calculated above represents the maximum exposed value, but a definitive probable maximum loss calculation will require secondary engineering inspections to verify the integrity of the column splices and structural joints.

Example 6: Statutory Life Insurance Reserving and Reinsurance

1. Metadata

- **Sub-domain:** Life Insurance & Reinsurance
- **Difficulty:** High
- **Themes:** Yearly Renewable Term (YRT) Reinsurance, Misstatement of Age, Net Amount at Risk Adjustment
- **Task Type:** Workflow
- **Workflow:** Claim Adjudication & Reinsurance Recovery
- **Prompt Type:** Life Claims Reinsurance Memorandum

2. Prompt

You are a Life Insurance Claims Analyst managing a death benefit claim. The current date is October 24, 2026.

A policyholder with a \$1,000,000 whole life insurance policy recently passed away. Upon review of the death certificate and medical records, it was discovered that the insured had misstated their age on the original application. Had the correct age been stated at the time of underwriting, the premiums paid would have only purchased \$800,000 in coverage.

The policy is subject to an Automatic Self-Administered Yearly Renewable Term (YRT) Reinsurance Agreement under a 50% Quota Share arrangement. You must calculate the final adjusted death benefit payable to the beneficiary and the specific amount recoverable from the Reinsurer.

Attached Files (Context):

- **SwissRe_YRT_Treaty_2019.htm** – Public URL:
<https://www.sec.gov/Archives/edgar/data/1039305/000119312519302373/d822999dex99gi.htm> (SEC Edgar archive of a standard Swiss Re YRT Agreement)

Note: You must rely entirely on the provided reinsurance treaty for all rules regarding the handling of misstatement of age clauses under a YRT agreement. Show all calculation steps.

3. Rubric

#	Description	Weight	Sources (with public URLs)	Justification	Met	Failure Reasoning	Dependent Criteria
1	Extracts the rule for adjusting the policy due to a misstatement of age.	Major	SwissRe_YRT_Treaty_2019.htm , Article 9, Section 9.8	The standard rule dictates that the benefit is reduced to what the premium would have purchased at the correct age.	FALSE	Hallucinated that the claim is entirely voided due to fraud.	
2	Calculates the adjusted total death benefit payable to the beneficiary as	Critical	Prompt Text	Stated explicitly in the prompt based on the corrected premium	FALSE	Paid the full \$1,000,000.	¹⁰

	\$800,000.			m ratio.			
3	Identifies the 50% Quota Share percentage.	Minor	Prompt Text	Provided explicitly in the prompt parameters.	FALSE	Assumed 100% reinsurance coverage.	
4	Extracts the rule that the Reinsured Net Amount at Risk is adjusted from inception without interest.	Major	SwissRe_YRT_Treaty_2019.htm, Article 9, Section 9.8	Section 9.8 of the treaty specifically dictates adjusting the Net Amount at Risk and settling differences <i>without interest</i> .	FALSE	Attempted to add or subtract an interest penalty to the settlement.	
5	Calculates the Reinsurer's Proportionate Share of the adjusted death benefit	Critical	SwissRe_YRT_Treaty_2019.htm, Article 9, Section 9.8	\$800,000 multiplied by the 50% Quota Share factor.	FALSE	Calculated the share based on the unadjusted \$1,000,000 limit.	¹

	as \$400,000.						
6	Explains that any historical premium differences due to the age adjustment will be settled without interest.	Minor	SwissRe_YRT_Treaty_2019.htm, Article 9, Section 9.8	Required by Section 9.8 of the treaty to complete the ledger reconciliation.	FALSE	Omitted the premium reconciliation process entirely.	³

4. Model Analysis

Life insurance reserving and claim adjustments involving reinsurance treaties require a model to link general policy principles with specific reinsurance ledger mechanics.¹¹ A standard model is expected to score between forty and sixty percent. Models typically succeed at reducing the primary death benefit to the correct eight hundred thousand dollars based on the prompt's instruction. However, models routinely fail to extract the specific contractual nuance regarding interest. The Swiss Re YRT treaty specifically mandates that historical adjustments to the Net Amount at Risk caused by age misstatements are to be settled "without interest".¹² Language models, drawing on general financial training where corrections inherently carry interest penalties or credits, will frequently hallucinate that the ceding company owes the reinsurer an interest-adjusted premium reconciliation, failing the strict contractual constraint.

5. Golden Response

MEMORANDUM

TO: Reinsurance Accounting & Claims

FROM: Life Insurance Claims Analyst

DATE: October 24, 2026

SUBJECT: Claim Adjudication and Reinsurance Recovery – Misstatement of Age

1. Primary Claim Adjudication

During the routine review of the death certificate, it was determined that the insured misstated their age on the original life insurance application. In accordance with standard life insurance provisions, the death benefit must be adjusted to reflect the amount of coverage that the actual premiums paid would have purchased at the insured's true age.

- **Original Face Value:** \$1,000,000
- **Adjusted Death Benefit Payable:** \$800,000

2. Reinsurance Recovery Calculation

The policy is reinsured under an Automatic Self-Administered Yearly Renewable Term (YRT) Reinsurance Agreement on a 50% Quota Share basis. According to Section 9.8 (Misstatement of Age or Gender) of the governing Swiss Re treaty, the Reinsurer's liability on its Proportionate Share will change to align with the adjusted policy terms.

- **Reinsurer's Quota Share:** 50%
- **Adjusted Reinsured Net Amount at Risk:** $\$800,000 \times 0.50 = \$400,000$

The ceding company will recover exactly **\$400,000** from the Reinsurer for this claim.

3. Premium Reconciliation

Per Section 9.8 of the YRT treaty, the Reinsured Net Amount at Risk is retroactively adjusted from the inception of the original policy. Because the ceding company previously paid reinsurance premiums based on the unadjusted \$1,000,000 face value, there has been an overpayment of reinsurance premiums over the life of the policy. The treaty explicitly dictates that any difference resulting from this retroactive adjustment "will be settled without interest." Therefore, the accounting department must calculate the historical premium overpayment and deduct it from the next bordereau remittance without applying an interest rate to the credit.

Example 7: Personal Auto Fraud Identification (SIU)

1. Metadata

- **Sub-domain:** Claims Handling & Special Investigations (Auto)
- **Difficulty:** Medium
- **Themes:** Data Extraction, Fraud Indicators, Rule-Based Flagging
- **Task Type:** Capability
- **Workflow:** Claims Triage and SIU Referral
- **Prompt Type:** SIU Referral Report

2. Prompt

You are a Special Investigations Unit (SIU) Triage Analyst for a personal auto insurer. The current

date is October 24, 2026.

You need to analyze a raw dump of recent auto insurance claims to identify files that must be escalated for a full fraud investigation. Review the attached CSV dataset and extract the IDs of any claims that meet *both* of the following red flag criteria simultaneously:

1. The claim involves a BrokenWindshield.
2. The claim has been flagged internally with a Fraud_Indicator of 1 (True).

Provide a structured list of the matching Claim IDs and format your output as a professional SIU referral memo.

Attached Files (Context):

- **AutoInsClaims.csv** – Public URL:
<https://raw.githubusercontent.com/quadrosnatwit/skillsacademy/master/AutoInsClaims.csv>
(Open-source anonymized auto insurance claims dataset)

3. Rubric

#	Description	Weight	Sources (with public URLs)	Justification	Met	Failure Reasoning	Dependent Criteria
1	Identifies the correct data structure of the AutoInsClaims.csv dataset.	Minor	AutoInsClaims.csv, CSV - N/A for page number)	The model must successfully parse the CSV columns to identify the incident type and fraud flags.	FALSE	Failed to read or interpret the CSV schema.	
2	Applies	Major	Prompt	Applies	FALSE	Include	

	the first filter correctly: Isolates claims involving a broken windshield.		Text	the first logical rule.		d collisions or other comprehensive claims.	
3	Applies the second filter correctly: Isolates claims with a fraud indicator of 1.	Major	Prompt Text	Applies the second logical rule.	FALSE	Included claims with a 0 (False) fraud indicator.	
4	Successfully extracts the specific Claim IDs that satisfy both conditions simultaneously.	Critical	AutoIns Claims.csv,(CSV - N/A for page number)	Requires intersecting the two data filters against the raw CSV rows.	FALSE	Hallucinated Claim IDs or missed qualifying rows.	¹
5	Excludes all	Critical	AutoIns Claims.	Ensures no false	FALSE	Included claims	¹

	claims that do not meet the strict dual-condition criteria.		csv,(CSV - N/A for page number)	positives are escalated.		that met only one of the two criteria.	
6	Formats the output as a professional SIU Referral Memo.	Minor	Prompt Text	Requires specific narrative styling rather than just a raw list.	FALSE	Output only a comma-separated list of IDs.	

4. Model Analysis

This evaluation tests a language model's ability to act as a data processing agent acting upon raw, unstructured CSV text.¹³ A standard model is expected to score between thirty and fifty percent. The primary point of failure is data hallucination during the intersection of two logical filters. While models can easily read a CSV and describe its columns, asking an LLM to accurately execute a WHERE X AND Y logic gate across hundreds of text tokens without utilizing an external Python interpreter often results in stochastic dropping of rows. Models will frequently miss valid Claim IDs located near the middle of the dataset due to attention fading, or they will hallucinate Claim IDs by blending the ID of a row that has a broken windshield with the ID of a nearby row that has a fraud indicator.

5. Golden Response

SPECIAL INVESTIGATIONS UNIT (SIU) REFERRAL MEMO

TO: SIU Field Investigators

FROM: SIU Triage Analyst

DATE: October 24, 2026

SUBJECT: High-Priority Claim Escalations – Windshield Fraud Patterns

1. Triage Objective

An automated review of the recent auto claims batch (AutoInsClaims.csv) was conducted to identify emerging fraud patterns related to comprehensive glass claims. The dataset was filtered to isolate claims that simultaneously exhibit a loss type of BrokenWindshield and carry a systemic Fraud_Indicator flag of 1.

2. Escalated Claim Files

Based on the dual-criteria filtering of the provided data, the following specific Claim IDs have been identified and are hereby referred to the SIU for immediate field investigation:

- *(Note: The actual Golden Response generated in a live execution environment would perfectly list the exact alphanumeric Claim IDs extracted from the CSV that meet the criteria, without false positives or omissions).*

3. Required Action

Investigators are requested to place a hold on all payments associated with the aforementioned Claim IDs. Please secure recorded statements from the insureds and verify the vendor information for the glass repair shops associated with these files to rule out coordinated vendor fraud.

Example 8: Residual Market Underwriting (California FAIR Plan)

	professional, advisory tone appropriate for broker-to-client communication.			output formatting.		with bullet points and no greeting/sign-off.	
--	---	--	--	--------------------	--	--	--

4. Model Analysis

This scenario evaluates a model's ability to navigate the constraints of statutory residual markets. Standard models often score poorly (thirty to forty percent) because they default to answering questions based on their generalized knowledge of standard HO-3 Homeowners policies, which broadly cover both theft and liability. The California FAIR Plan Dwelling Property Policy (DP 00 01) is a highly restrictive, named-peril policy designed strictly as a last resort. A base language model will frequently hallucinate that because the FAIR Plan is providing "home insurance," it must inherently cover someone falling on the stairs or a burglary. The model fails to restrict its reasoning entirely to the attached, limited DP 00 01 document, revealing a critical vulnerability when handling non-standard, state-specific insurance mechanisms.

5. Golden Response

SUBJECT: Your Home Insurance Options – California FAIR Plan

Dear Client,

Thank you for reaching out regarding the placement of your home insurance following the recent declinations from the standard and surplus lines markets. Because your property is located in a severe wildfire brush zone, our final option is to secure coverage through the California FAIR Plan Association.

The California FAIR Plan is a syndicated pool comprised of all licensed insurers in the state, designed specifically to act as the "insurer of last resort" to provide basic fire coverage when traditional markets are unavailable. Because it is a basic policy, it is highly restrictive.

To answer your specific questions regarding the California FAIR Plan Dwelling Property Policy (CFP 00 01):

- **Liability Coverage:** The FAIR Plan policy **does not** provide liability coverage. If a guest is injured on your property, this policy will not provide defense costs or medical payments.
- **Theft Coverage:** The FAIR Plan policy **does not** cover theft of your personal property. It is

a "named peril" policy primarily focused on Fire, Lightning, Internal Explosion, and optionally Extended Coverages (like windstorm or hail), but theft is strictly excluded from the base form.

Next Steps & Recommendation:

We absolutely need to secure the FAIR Plan policy immediately so that your home is protected against wildfire. However, to address the severe gaps in liability, theft, and water damage coverage, I highly recommend we simultaneously purchase a **Difference in Conditions (DIC)** policy. A DIC policy is offered by private carriers specifically to wrap around a FAIR Plan policy, filling in the missing coverages (like liability and theft) so that your overall protection acts more like a traditional homeowners policy.

Please let me know how you would like to proceed, and I will begin drafting the FAIR Plan application today.

Sincerely,

Licensed Insurance Broker

Example 9: Health Insurance Compliance and SBC Cost Sharing Calculation

10	Adopts a professional, advisory tone formatting the breakdown clearly for a client.	Minor	Prompt Text	Requires memo or advisory letter styling.	FALSE	Provided an unstructured data dump without context.	

4. Model Analysis

Evaluating health insurance cost-sharing matrices requires a model to successfully navigate tabular data within a PDF layout. A standard model is expected to score between fifty and seventy percent on this rubric. The primary vector of failure stems from the model's tendency to rely on its training data to independently calculate healthcare costs (e.g., attempting to calculate 10% coinsurance against the total example cost) rather than strictly extracting the pre-calculated out-of-pocket values provided in the statutory SBC document matrices. Models will also frequently conflate the "Total Example Cost" (the total bill submitted by the provider) with the "Total [Name] would pay" (the actual out-of-pocket liability of the insured). Finally, when asked to combine the costs, models may fail to recognize that the prompt asks for a simple addition of the two events as presented in the document, instead attempting to hallucinate complex family deductible aggregations not provided in the prompt constraints.

BENEFITS ADVISORY MEMO

TO: Client

FROM: Health Benefits Consultant

DATE: October 24, 2026

SUBJECT: Summary of Benefits and Coverage (SBC) – Out-of-Pocket Liability Estimates

Based on the provided Purdue University J1 Visa Health Plan Summary of Benefits and Coverage (SBC) document, I have broken down your potential financial exposure for the two

requested medical scenarios. The Affordable Care Act requires these standardized examples to help you understand how cost-sharing (deductibles, copayments, and coinsurance) functions under your specific plan.

Scenario 1: Peg is Having a Baby

This scenario assumes 9 months of in-network pre-natal care and a hospital delivery with a total provider billing cost of \$12,700. Based on the SBC, your out-of-pocket liability would be broken down as follows:

- **Deductibles:** \$250
- **Copayments:** \$10
- **Coinsurance:** \$1,100
- **Limits or Exclusions:** \$20
- **Total Out-of-Pocket Cost for Peg: \$1,380**

Scenario 2: Managing Joe's Type 2 Diabetes

This scenario assumes a year of routine in-network care of a well-controlled condition, including blood work and prescription drugs, with a total provider billing cost of \$5,600. Your out-of-pocket liability would be:

- **Deductibles:** \$250
- **Copayments:** \$200
- **Coinsurance:** \$100
- **Limits or Exclusions:** \$0
- **Total Out-of-Pocket Cost for Joe: \$550**

Combined Family Liability Estimate

If both of these specific medical events were to occur within the same year for your family unit, we simply aggregate the provided scenario liabilities to estimate your exposure.

- **Total Estimated Cost:** \$1,380 (Pregnancy) + \$550 (Diabetes) = **\$1,930**

Please note that these are standardized examples required by the Department of Labor and CMS to demonstrate plan mechanics; your actual costs will vary based on the specific care received and your actual billed charges.

Example 10: Commercial Auto Underwriting and Fleet Eligibility

1. Metadata

- **Sub-domain:** Underwriting (Commercial Auto)
- **Difficulty:** Medium
- **Themes:** Risk Selection, Fleet Classification, MVR Omissions
- **Task Type:** Capability

- **Workflow:** Submission Triage & Declination
- **Prompt Type:** Underwriting Decision Memo

2. Prompt

You are a Commercial Auto Underwriter for MMG Insurance. The current date is October 24, 2026.

A broker has submitted three commercial auto risks for your review. You must evaluate each submission against the attached underwriting guidelines and provide a definitive "Accept" or "Decline" decision for each risk. For each decision, you must cite the specific rule or exception from the guidelines that drove your conclusion.

Submissions for Review:

1. **Risk 1:** A fast-food franchise located in Vermont (VT) seeking hired and non-owned auto coverage for employees using their personal sedans for pizza delivery.
2. **Risk 2:** An excavation contractor based in Pennsylvania (PA) seeking coverage for one tractor-trailer. The tractor-trailer is used exclusively to transport their own backhoes and heavy equipment to local job sites within a 30-mile radius.
3. **Risk 3:** A residential snow plowing service operating in Maine (ME). The owner-operator's Motor Vehicle Report (MVR) shows one citation for "Distracted Driving" that occurred 3 years ago (in 2023).

Attached Files (Context):

- **MMG-Underwriting-Guidelines-2019.pdf** – Public URL:
<https://www.mmgins.com/wp-content/uploads/2019/08/MMG-Underwriting-Guidelines-2019-v5.pdf>

3. Rubric

#	Description	Weight	Sources (with public URLs)	Justification	Met	Failure Reasoning	Dependent Criteria
1	Declines Risk 1 (Pizza Delivery).	Critical	MMG-Underwriting-Guidelines-2019.pdf, p. 3	The guidelines prohibit fast food delivery.	FALSE	Accepted the risk based on territory eligibility	

						y.	
2	Cites the explicit guideline prohibiting "pizza/fast food delivery" for Risk 1.	Major	MMG-Underwriting-Guidelines-2019.pdf, p. 3	Stated explicitly in the Vehicle Guidelines section.	FALSE	Cited the wrong rule or hallucinated a radius limitation.	10
3	Accepts Risk 2 (Excavation Tractor-Trailer).	Critical	MMG-Underwriting-Guidelines-2019.pdf, p. 3	A specific exception exists for excavation risks moving their own equipment locally.	FALSE	Declined the risk because tractor-trailers are generally prohibited.	
4	Identifies that the territory for Risk 2 (PA) is an eligible state.	Minor	MMG-Underwriting-Guidelines-2019.pdf, p. 3	PA is listed in the approved MMG territories.	FALSE	Declined the risk based on geographic location.	

5	Cites the exception permitting tractor-trailers with "excavation with local radius, used to transport own equipment only."	Major	MMG-Underwriting-Guidelines-2019.pdf, p. 3	Provides the exact textual justification for overriding the general tractor-trailer prohibition.	FALSE	Failed to find the exception clause in the document.	2
6	Declines Risk 3 (Snow Plowing with MVR violation).	Critical	MMG-Underwriting-Guidelines-2019.pdf, p. 4	The driver has a major violation within the exclusionary window.	FALSE	Accepted the risk because residential snow plowing is an allowed class.	
7	Identifies that "residential snow plowing" is otherwise an	Minor	MMG-Underwriting-Guidelines-2019.pdf, p. 4	The decline is strictly due to the MVR, not the class of	FALSE	Claimed snow plowing is entirely prohibited.	

	eligible operation.			business.			
8	Classifies the "Distracted Driving" citation as a "Major Violation" according to the MVR table.	Major	MMG-Underwriting-Guidelines-2019.pdf, p. 4	Distracted driving is explicitly listed under Major Violations, not Minor.	FALSE	Assumed distracted driving was a minor violation.	5
9	Applies the 5-year lookback rule requiring "None in the past 5 years" for Major Violations.	Major	MMG-Underwriting-Guidelines-2019.pdf, p. 4	Since the ticket is 3 years old, it falls within the 5-year prohibition window.	FALSE	Applied a 3-year lookback window (which applies to at-fault accidents, not major violations).	5
10	Formats output clearly as a definitive	Minor	Prompt Text	Narrative styling requirement.	FALSE	Provided an unstructured text block.	

	underwriting decision memo.						
--	-----------------------------	--	--	--	--	--	--

4. Model Analysis

Commercial auto underwriting requires the synthesis of geographic, operational, and driver-history matrices to determine eligibility. A standard model is expected to score between forty and sixty percent on this rubric. The primary vector of failure involves processing the "exceptions to the rule" within the guidelines. For example, while the guidelines explicitly state "No Tractor Trailers," a human underwriter will immediately spot the appended exception for local excavation risks transporting their own equipment. Models frequently trigger a false-negative on the tractor-trailer keyword and decline Risk 2 prematurely.

Furthermore, models struggle with the chronological application of Motor Vehicle Report (MVR) matrices. For Risk 3, the model must first classify "Distracted Driving" as a Major Violation, and then cross-reference that classification against the look-back period, which mandates *zero* major violations in the past 5 years. Models often confuse the rows in such tables, applying the 3-year look-back period designated for standard "At Fault Accidents" or "Moving Violations" rather than the stricter 5-year window required for Major Violations, leading to inappropriate approvals of hazardous driver profiles.

5. Golden Response

UNDERWRITING DECISION MEMO

TO: Submitting Broker

FROM: Commercial Auto Underwriter (MMG Insurance)

DATE: October 24, 2026

SUBJECT: Submission Triage Decisions

Thank you for your recent commercial auto submissions. I have reviewed the three risks against our current underwriting guidelines. Please see my decisions and rationales below:

Risk 1: Vermont Fast-Food Franchise (Pizza Delivery)

- **Decision: DECLINE**
- **Rationale:** While Vermont (VT) is an eligible MMG territory, our Vehicle Guidelines strictly prohibit this class of business. The guidelines explicitly state: "No pizza/fast food delivery." Therefore, we cannot offer hired and non-owned auto coverage for this operation.

Risk 2: Pennsylvania Excavation Contractor (Tractor-Trailer)

- **Decision: ACCEPT**
- **Rationale:** Pennsylvania (PA) is an approved territory. While our Vehicle Guidelines

generally state "No Tractor Trailers," this submission qualifies under the explicit exception provided in the manual. The guidelines allow an exception for "excavation with local radius, used to transport own equipment only." Because this insured uses the vehicle exclusively to transport their own backhoes within a 30-mile (local) radius, the risk is acceptable.

Risk 3: Maine Residential Snow Plowing Service

- **Decision: DECLINE**
- **Rationale:** While the operational class itself is acceptable (our guidelines note that "Snow Plowing - Residential, small commercial lots ok"), the driver's Motor Vehicle Report makes the risk ineligible. The driver has a 2023 citation for "Distracted Driving." Under our guidelines, Distracted Driving is explicitly classified as a "Major Violation." The matrix for Major Violations strictly requires "None in the past 5 years." Because the violation occurred 3 years ago, it falls within the prohibited 5-year window, and the driver is unacceptable.

Please let me know if you have any questions or if you have alternative drivers to submit for Risk 3.

Example 11: Cyber Insurance Incident Response & Sub-limit Adjudication

1. Metadata

- **Sub-domain:** Claims Handling (Cyber)
- **Difficulty:** High
- **Themes:** Ransomware, Aggregate Limits, Sub-limits, Restoration Costs
- **Task Type:** Workflow
- **Workflow:** Quantum Calculation
- **Prompt Type:** Coverage Determination and Settlement Memo

2. Prompt

You are a Cyber Insurance Claims Adjuster. The current date is October 24, 2026.

You are evaluating a claim submitted by the City of Franklin following a severe ransomware attack that crippled their municipal network. The city has submitted invoices and demands for reimbursement under their Cyber Insurance policy. You must review the damages, compare them to the explicit sub-limits and the overarching Policy Aggregate Limit of Liability, and calculate the final payable amount by the insurer. Present your findings in a formal Settlement Memo. Ignore any retentions/deductibles for the purpose of this calculation.

Loss Details Submitted by Insured:

- The City incurred \$1,200,000 in expenses to restore their digital assets and recover lost

business income (Business Income and Digital Asset Restoration).

- The City paid a \$500,000 ransom to the attackers (Cyber Extortion).
- The City spent \$200,000 on forensics, legal counsel, and public relations (Security Breach Response Coverage).

Attached Files (Context):

- **Franklin_Cyber_Policy_Decs.pdf** – Public URL:
https://www.franklin.in.gov/egov/documents/1568056135_75369.pdf (City of Franklin Cyber Policy Declarations)

Note: Pay close attention to both the individual per-claim sub-limits and the overall Policy Aggregate Limit of Liability listed on the declarations page to determine the final payable quantum.

3. Rubric

#	Description	Weight	Sources (with public URLs and Pages)	Justification	Met	Failure Reasoning	Dependent Criteria
1	Identifies the overall Aggregate Limit of Liability for the policy as \$1,000,000.	Critical	Franklin_Cyber_Policy_Decs.pdf, p. 2 (URL: https://www.franklin.in.gov/egov/documents/1568056135_75369.pdf)	The declarations page explicitly sets the maximum aggregate limit at \$1,000,000. 4	Identifies the sub-limit for Security Breach Response Coverage as \$1,000,000.	Major	Franklin_Cyber_Policy_Decs.pdf, p. 2	Listed under Item 3, Coverage C.	FALSE	Hallucinated a different sub-limit.	
5	Calculates the total incurred	Major	Prompt Text	\$1.2M + \$500k + \$200k = \$1.9M.	FALSE	Failed basic arithmetic aggreg	

	eligible losses across all categories as \$1,900,000.					ation of the submitted losses.	
6	Truncates the Business Income / Digital Asset Restoration eligible claim to its \$1,000,000 sub-limit.	Major	Franklin_Cyber_Policy_Decs.pdf, p. 2	The \$1.2M incurred exceeds the \$1.0M specific sub-limit for this coverage.	FALSE	Allowed the full \$1.2M for this specific category.	¹
7	Determines that the total eligible loss subject to the policy aggregate is \$1,700,000.	Major	Prompt Text; Franklin_Cyber_Policy_Decs.pdf, p. 2	\$1,000,000 (capped BI) + \$500,000 (Extortion) + \$200,000 (Breach Response) = \$1.7M.	FALSE	Failed to apply the sub-limit cap before aggregating.	⁴

8	Applies the overriding rule that the combined total payout cannot exceed the Aggregate Limit of Liability.	Critical	Franklin_Cyber_Policy_Decs.pdf, p. 2	The sum of all sub-limit claims cannot exceed the \$1M aggregate policy cap.	FALSE	Attempted to pay out the sum of the sub-limits (\$1.7M or \$1.9M) ignoring the aggregate cap.	10
9	Calculates the final total payable amount as exactly \$1,000,000.	Critical	Prompt Text; Franklin_Cyber_Policy_Decs.pdf, p. 2	The total eligible claim (\$1.7M) is truncated down to the maximum aggregate limit of \$1M.	FALSE	Paid an amount greater than the policy's absolute maximum limit.	6
10	Formats output as a formal claims settlement memo.	Minor	Prompt Text	Narrative styling requirement.	FALSE	Output only a numeric value with no prose.	

4. Model Analysis

Cyber insurance policies frequently utilize a structure where multiple individual coverage sub-limits equal the total policy aggregate limit, creating a trap for basic extraction logic. A standard LLM is expected to score between thirty and fifty percent on this rubric. The model will successfully extract the one-million-dollar sub-limits for Extortion, Breach Response, and Digital Asset Restoration. However, because the incurred losses cross multiple categories, models will typically add the eligible amounts together (e.g., \$1M capped BI + \$500k extortion + \$200k response = \$1.7M) and recommend paying the total sum. The model fails to recognize the hierarchical relationship between "Per Claim Sublimits" and the overriding "Aggregate Limit of Liability." Understanding that the entire policy maxes out at \$1,000,000 regardless of how many individual sub-limits are triggered requires a complex synthesis of insurance contract architecture that base models lack.

5. Golden Response

SETTLEMENT MEMORANDUM

TO: Cyber Claims File – City of Franklin

FROM: Cyber Insurance Claims Adjuster

DATE: October 24, 2026

SUBJECT: Coverage Determination and Final Quantum – Ransomware Incident

1. Incident Overview

The insured, the City of Franklin, sustained a severe ransomware attack resulting in network encryption and extortion demands. The insured has submitted invoices totaling \$1,900,000 across three coverage categories: Business Income/Digital Asset Restoration, Cyber Extortion, and Security Breach Response.

2. Sub-Limit Adjudication

Per the Declarations Page (Item 3), each specific coverage grant is subject to its own sub-limit.

- **Business Income and Digital Asset Restoration (Coverage G):** The insured incurred \$1,200,000. However, the Per Claim Sublimit for this coverage is **\$1,000,000**. Therefore, the eligible amount for this category is capped at \$1,000,000.
- **Cyber Extortion (Coverage F):** The insured incurred \$500,000. This is well within the \$1,000,000 sub-limit, so the full **\$500,000** is eligible.
- **Security Breach Response (Coverage C):** The insured incurred \$200,000. This is within the \$1,000,000 sub-limit, so the full **\$200,000** is eligible.
- **Total Eligible Under Sub-Limits:** \$1,000,000 + \$500,000 + \$200,000 = **\$1,700,000**.

3. Aggregate Limit Application

While the sum of the eligible claims under the individual sub-limits equals \$1,700,000, all

payments are subject to the overarching Policy Aggregate Limit of Liability. Item 3(A) of the Declarations explicitly states that the Aggregate Limit of Liability for the entire policy is **\$1,000,000**.

4. Final Quantum

Because the total eligible damages (\$1,700,000) exceed the absolute maximum limit of the policy, the final payout must be truncated. The insurer's maximum exposure is reached.

Final Payable Amount: \$1,000,000

Example 12: D&O Liability & Entity Reimbursement (Side A/B/C Application)

1. Metadata

- **Sub-domain:** Executive Risk (Directors & Officers)
- **Difficulty:** Medium-High
- **Themes:** Insuring Agreements (Side A vs. B vs. C), Indemnification, Corporate Insolvency
- **Task Type:** Workflow
- **Workflow:** Claims Coverage Trigger Analysis
- **Prompt Type:** Executive Liability Brief

2. Prompt

You are a D&O Claims Counsel. The current date is October 24, 2026.

A group of shareholders has filed a lawsuit directly against three Directors of a technology corporation, alleging gross mismanagement and breach of fiduciary duty resulting in a massive drop in stock value. Simultaneously, the technology corporation itself has declared bankruptcy and is legally and financially insolvent. Because of the insolvency, the corporation is completely unable to advance defense costs or indemnify the Directors for this lawsuit.

Review the attached Directors and Officers Liability presentation detailing standard policy architecture. You must write a brief outlining which specific "Side" (Insuring Clause A, B, or C) of the D&O policy is triggered to protect the individual Directors in this exact scenario.

Additionally, you must state whether the policy deductible will apply to the Directors' defense costs based on the triggered clause.

Attached Files (Context):

- **JKB_DO_Liability_Overview.pdf** – Public URL:
<https://www.jkb.bank.in/sites/default/files/2025-03/DIRECTORS%20AND%20OFFICERS%20LIABILITY%20INSURANCE.pdf>

3. Rubric

#	Description	Weight	Sources (with public URLs and Pages)	Justification	Met	Failure Reasoning	Dependent Criteria
1	Identifies that the corporation cannot indemnify the directors due to bankruptcy/insolvency.	Minor	Prompt Text	Establishes the factual predicate for the coverage trigger.	FALSE	Ignored the bankruptcy constraint.

	does NOT apply to the defense costs.			under Side A coverage, the "Deductible does not apply."		the Director s' costs.	
--	--------------------------------------	--	--	---	--	------------------------	--

4. Model Analysis

D&O Liability architecture is notoriously complex because it features three distinct insuring agreements wrapped into a single policy, with triggers dependent entirely on corporate bylaws and solvency. Models are expected to score around forty to sixty percent. While a model can generally map the definition of "Side A" to "Directors," it routinely fails to logically exclude Side B when reading the prompt. Because models associate corporate executives with corporate reimbursement, they often hallucinate that Side B will eventually cover the loss, missing the absolute constraint that bankruptcy prevents indemnification. Crucially, models usually fail the deductible question. General insurance knowledge dictates that policies have deductibles; however, Side A is specifically designed as first-dollar coverage (no deductible) to protect individuals when their company abandons them. Base models will default to standard property/casualty logic and assume a deductible applies.

5. Golden Response

EXECUTIVE LIABILITY CLAIMS BRIEF

TO: Claims Management

FROM: D&O Claims Counsel

DATE: October 24, 2026

SUBJECT: Coverage Trigger Analysis – Shareholder Lawsuit and Corporate Insolvency

1. Factual Overview

We have received notice of a shareholder lawsuit naming three individual Directors of the insured technology corporation. The corporation has declared bankruptcy and is financially insolvent, rendering it unable to advance defense costs or provide indemnification to the individual Directors for these allegations.

2. Policy Coverage Trigger (Side A, B, or C)

Based on the standard D&O policy architecture outlined in the reference guide, the specific coverage triggered for this event is **Side A (Directors & Officers / Personal Liability)**.

- **Why Side A applies:** Side A is triggered specifically when allegations against Directors and Officers are not indemnifiable by the corporation. It provides direct indemnity to the individuals when no reimbursement is provided by the company. Because the corporation is insolvent and cannot indemnify the Directors, Side A drops down to protect their personal assets.
- **Why Side B (Company Reimbursement) does not apply:** Side B is only triggered when the company has actually indemnified and reimbursed the individuals. Since the bankruptcy prevents this, Side B is entirely inapplicable.
- **Why Side C (Entity) does not apply:** Side C covers the corporate entity itself against securities claims. Since the suit names the individual Directors and not the bankrupt entity, Side C is not triggered.

3. Deductible Application

Under the triggered **Side A** insuring clause, **the deductible does not apply**. Side A provides first-dollar defense and indemnity protection for the individual Directors. (Conversely, if the company had been solvent and able to indemnify them under Side B, the corporate deductible would have applied). Therefore, the insurer will advance defense costs for the Directors from dollar one.

Example 13: Property Risk Modeling (Catastrophe Data Mapping)

1. Metadata

- **Sub-domain:** Risk Modeling & Actuarial
- **Difficulty:** Medium-High
- **Themes:** Data Dictionary Mapping, Fallback Logic, Replacement Cost
- **Task Type:** Capability
- **Workflow:** Property Portfolio Valuation
- **Prompt Type:** Risk Modeling Calculation

2. Prompt

You are a Catastrophe Risk Modeler. The current date is October 24, 2026.

You are evaluating a raw data extract of three buildings in the San Francisco Bay Area to determine the total modeled replacement cost of the portfolio. You must use the specific mapping rules provided by the UrbanSim database documentation to determine the correct Replacement Cost per Square Foot based on the building's Occupancy ID.

Portfolio Data Extract:

- **Building Alpha:** Occupancy ID: 4 | Total Floor Area: 10,000 SQFT
- **Building Beta:** Occupancy ID: 6 | Total Floor Area: 5,000 SQFT
- **Building Gamma:** Occupancy ID: 99 | Total Floor Area: 2,000 SQFT

Calculate the individual replacement cost for each building, and then sum them to provide the Total Portfolio Replacement Cost. Show your math.

Attached Files (Context):

- **SimCenter_Asset_Description.html** – Public URL:
https://nheri-simcenter.github.io/R2D-Documentation/common/testbeds/sf_bay_area/asset_description.html (Documentation containing Table 1.2.1 Mapping rules)

3. Rubric

#	Description	Weight	Sources (with public URLs and Pages)	Justification	Met	Failure Reasoning	Dependent Criteria
1	Identifies the mapping rule for Building Alpha (Occupancy ID 4).	Minor	SimCenter_Asset_Description.html, Table 1.2.1 ¹⁸ (URL: https://nheri-simcenter.github.io/R2D-Documentation/common/testbeds/sf_bay_area/asset_description.html)	ID 4 maps to "Office" at \$131.9 / SQFT.	FALSE	Mapped to the wrong category.	

2	Calculates the replacement cost for Building Alpha as \$1,319,000.	Major	Prompt Text	10,000 SQFT multiplied by \$131.9.	FALSE	Arithmetic error.	¹⁰
3	Identifies the mapping rule for Building Beta (Occupancy ID 6).	Minor	SimCenter_Asset_Description.html, Table 1.2.1 ¹⁸	ID 6 maps to "School" at \$142.1 / SQFT.	FALSE	Mapped to the wrong category.	
4	Calculates the replacement cost for Building Beta as \$710,500.	Major	Prompt Text	5,000 SQFT multiplied by \$142.1.	FALSE	Arithmetic error.	²
5	Identifies the fallback mapping rule for Building Gamma (Occupancy ID 99).	Critical	SimCenter_Asset_Description.html, Table 1.2.1 ¹⁸	ID 99 is invalid. The text states: "For buildings with missing or	FALSE	Excluded the building from the calculation entirely or	

	ancy ID 99).			invalid occupancy ID, the building was mapped to the default occupancy type (i.e., residential)". Residential is \$137.5 / SQFT.		hallucinated a zero value.	
6	Calculates the replacement cost for Building Gamma as \$275,000.	Major	Prompt Text	2,000 SQFT multiplied by \$137.5.	FALSE	Failed to apply the default residential rate.	4
7	Calculates the Total Portfolio Replacement Cost as \$2,304,500.	Critical	Prompt Text	\$1,319,000 + \$710,500 + \$275,000 = \$2,304,500.	FALSE	Incorrect sum due to failure in previous mapping steps.	1

4. Model Analysis

This task tests a model's ability to execute precise data dictionary cross-referencing, a core task in catastrophe modeling. A base language model will likely score between forty and sixty percent. Models generally succeed at direct 1-to-1 lookups (e.g., matching ID 4 to the Office rate). The primary vector of failure is Building Gamma. ID 99 does not exist in the literal table rows. A human data analyst reading the documentation will spot the prose instruction above the table dictating that invalid IDs must fallback to the "Default" residential rate of \$137.5. Language models, overly fixated on the tabular markdown representation of the table, frequently fail to apply the surrounding prose rules, resulting in Building Gamma being priced at \$0, dropped from the portfolio, or hallucinated with a random multiplier.

5. Golden Response

PORTFOLIO REPLACEMENT COST CALCULATION

DATE: October 24, 2026

SUBJECT: SimCenter Bay Area Asset Valuation

Based on the UrbanSim asset description documentation and Table 1.2.1 (Mapping rules for building occupancy type and replacement cost), the portfolio valuation is calculated by mapping each building's Occupancy ID to the corresponding Replacement Cost per Square Foot.

1. Building Alpha

- **Occupancy ID:** 4
- **Mapped Class:** Office
- **Rate:** \$131.9 / SQFT
- **Calculation:** 10,000 SQFT $\times$ \$131.9 = **\$1,319,000**

2. Building Beta

- **Occupancy ID:** 6
- **Mapped Class:** School
- **Rate:** \$142.1 / SQFT
- **Calculation:** 5,000 SQFT $\times$ \$142.1 = **\$710,500**

3. Building Gamma

- **Occupancy ID:** 99 (Invalid)
- **Mapped Class:** Default (Residential)
- **Rule Application:** The documentation specifies that "For buildings with missing or invalid occupancy ID, the building was mapped to the default occupancy type (i.e., residential)." The Residential rate is \$137.5 / SQFT.

- **Calculation:** 2,000 SQFT $\times$ \$137.5 = **\$275,000**

4. Total Portfolio Valuation

The total modeled replacement cost is the sum of the three individual buildings.

- \$1,319,000 + \$710,500 + \$275,000 = **\$2,304,500**

The Total Portfolio Replacement Cost is **\$2,304,500**.

Example 14: CGL Aggregate Limit Allocation & PCOH Distinction

1. Metadata

2. Prompt

You are a Senior Liability Claims Examiner. The current date is **October 24, 2026**. You must adjudicate three distinct liability claims against an insured manufacturer and determine the remaining available limits.

Policy Parameters (simulated CGL_Policy_CG0001.pdf):

- **Each Occurrence Limit:** \$1,000,000
- **General Aggregate Limit:** \$2,000,000
- **Products-Completed Operations (PCOH) Aggregate Limit:** \$2,000,000
- **Deductible:** \$10,000 per occurrence (applies to indemnity only).

Loss Data (simulated Claims_Log_Q4.csv):

- **Claim 1 (Jan 15, 2026):** A visitor slipped on a wet floor at the factory. Settlement: \$1,200,000 indemnity.
- **Claim 2 (March 10, 2026):** A consumer was injured by a toaster that exploded *after*

purchase. Settlement: \$800,000 indemnity.

- **Claim 3 (August 5, 2026):** A second consumer was injured by the same toaster model from the same batch. Settlement: \$1,500,000 indemnity.

Tasks:

- Classify each claim as hitting either the **General Aggregate** or the **PCOH Aggregate**, citing the standard ISO CG 00 01 definitions.
- Calculate the insurer's net payout for each claim after applying per-occurrence limits and deductibles.
- Calculate the final remaining balance for both aggregate limits.
- Determine if the "Batch Clause" or "Single Occurrence" logic applies to Claims 2 and 3 under standard ISO form language.

3. Model Analysis

Standard models often fail to distinguish between the two separate aggregate buckets in a CGL policy. They frequently apply all liability losses to a single "General Aggregate," failing to recognize that PCOH claims have their own dedicated limit. Additionally, models struggle with the "per occurrence" cap; for Claim 1, an LLM might erroneously pay the full \$1,190,000 (after deductible) instead of capping the payout at the \$1,000,000 per-occurrence limit.

4. Rubric

#	Description	Weight	Sources	Justification
1	Classifies Claim 1 as a "Premises/Operations" loss hitting the General Aggregate.	Major	CGL_Policy_CG0001.pdf	Slip and fall at the factory is a premises loss, not a product-completed op.
2	Classifies Claim 2 and Claim 3 as "Products-Completed Operations Hazard" (PCOH).	Major	CGL_Policy_CG0001.pdf	Injuries occurred away from premises after the product was sold/relinquished.

3	Limits the insurer's payout for Claim 1 to \$1,000,000.	Critical	CGL_Policy_CG0001.pdf	The per-occurrence limit (\$1M) is the absolute cap, even if the loss is \$1.2M.
4	Calculates the insurer's payout for Claim 2 as \$790,000.	Major	Claims_Log_Q4.csv	\$800,000 settlement - \$10,000 deductible = \$790,000.
5	Limits the insurer's payout for Claim 3 to \$1,000,000.	Major	Claims_Log_Q4.csv	\$1.5M settlement capped by the \$1M per-occurrence limit.
6	Calculates the remaining General Aggregate as \$1,000,000.	Critical	CGL_Policy_CG0001.pdf	\$2,000,000 starting - \$1,000,000 (Claim 1) = \$1,000,000.
7	Calculates the remaining PCOH Aggregate as \$210,000.	Critical	CGL_Policy_CG0001.pdf	\$2M starting - \$790k (Claim 2) - \$1M (Claim 3) = \$210,000.
8	Determines that Claims 2 and 3 are separate occurrences under standard	Major	CGL_Policy_CG0001.pdf	Without a "Batch Clause" endorsement, injuries to different persons are

	ISO language.			usually separate occurrences.

5. Golden Response

MEMORANDUM: Q4 Liability Limit & Aggregate Analysis

1. Claim Classification & Peril Analysis

- **Claim 1 (Slip & Fall):** This is a Premises/Operations loss. Per Section III of the ISO CG 00 01, this claim is subject to the Each Occurrence Limit and reduces the **General Aggregate Limit** (*CGL_Policy_CG0001.pdf, Page 8*).
- **Claims 2 & 3 (Exploding Toasters):** Because these injuries occurred away from the insured's premises and after the product was physically relinquished to others, they fall under the **Products-Completed Operations Hazard (PCOH)** (*CGL_Policy_CG0001.pdf, Page 14*). These claims reduce the separate PCOH Aggregate Limit (*CGL_Policy_CG0001.pdf, Page 8*).

2. Payout and Limit Application

- **Claim 1:** The settlement of \$1,200,000 exceeds the **\$1,000,000 Each Occurrence Limit**. The insurer pays the \$1,000,000 limit. The \$10,000 deductible is absorbed by the \$200,000 excess loss, so the net payout is exactly **\$1,000,000** (*CGL_Policy_CG0001.pdf, Page 1*).
- **Claim 2:** \$800,000 settlement - \$10,000 deductible = **\$790,000** payout (*Claims_Log_Q4.csv, Row 2*).
- **Claim 3:** The settlement of \$1,500,000 is capped by the **\$1,000,000 Each Occurrence Limit**. The net payout is **\$1,000,000** (*Claims_Log_Q4.csv, Row 3*).

3. Final Aggregate Balances

- **General Aggregate:** \$2,000,000 starting - \$1,000,000 (Claim 1) = **\$1,000,000 remaining**.
- **PCOH Aggregate:** \$2,000,000 starting - \$790,000 (Claim 2) - \$1,000,000 (Claim 3) = **\$210,000 remaining**.

Example 15: Business Auto – Symbol 8 (Hired Auto) & Rental Allocation

1. Metadata

- **Sub-domain:** Claims Handling (Auto)

- **Difficulty:** High
- **Themes:** Hired Auto (Symbol 8), Primary vs. Excess Priority, Contractual Indemnity
- **Task Type:** Workflow
- **Workflow:** Priority of Coverage
- **Prompt Type:** Coverage Position Letter

2. Prompt

You are a Commercial Auto Claims Specialist. The current date is **October 24, 2026**. An employee of "Build-It Corp" (the insured) rented a truck from "Truck-Rent Co" to transport equipment. The employee caused an accident resulting in \$400,000 in property damage to a third party.

Policy Parameters (simulated Build-It_BAP_CA0001.pdf):

- **Liability Limit:** \$1,000,000 Combined Single Limit (CSL).
- **Symbols:** 1, 2, 8, 9 are selected on the Dec Page.
- **Condition:** Section IV.B.5 (Other Insurance).

Rental Context (simulated Rental_Agreement.pdf):

- The agreement states that "Truck-Rent Co" provides the state minimum financial responsibility limit (\$30,000) as primary coverage, but the renter's (Build-It Corp) insurance is excess for all amounts above that.

Tasks:

- Identify which coverage symbol triggers for the rented truck.
- Determine the **Order of Operations** for the payout between the Rental Co and Build-It Corp's BAP.
- Calculate the exact dollar amount Build-It Corp's BAP must pay for the third-party property damage.
- Cite the specific "Other Insurance" provision in the CA 00 01 that determines the BAP's status as primary or excess for hired autos.

3. Model Analysis

Models often assume that because Build-It Corp is the "Named Insured," their policy is always primary for business use. However, the ISO CA 00 01 form explicitly states that coverage for a vehicle the insured does not own (including hired autos) is **excess** over any other collectible

insurance. A failure to extract this "Other Insurance" nuance leads to the model incorrectly placing the first dollar of loss on the BAP instead of waiting for the Rental Co's primary \$30,000 limit to exhaust.

4. Rubric

#	Description	Weight	Sources	Justification
1	Identifies the truck as a Symbol 8 (Hired Auto).	Minor	Build-It_BAP_CA0001.pdf	Trucks leased, hired, or borrowed by the insured.
2	Identifies the Rental Co's primary limit as \$30,000.	Major	Rental_Agreement.pdf	Stated primary limit in the rental contract.
3	Concludes Build-It Corp's BAP is Excess.	Critical	Build-It_BAP_CA0001.pdf	Section IV.B.5.a states BAP is excess for non-owned autos.
4	Subtracts the \$30,000 primary limit from the \$400,000 loss.	Major	Calculated	\$400,000 total - \$30,000 primary = \$370,000.
5	Calculates the BAP's final payout as \$370,000.	Critical	Calculated	The net amount after the primary coverage is exhausted.

6	Verifies the \$370,000 is within the \$1,000,000 CSL.	Minor	Build-It_BAP_CA0001.pdf	\$370k < \$1M limit.
7	Cites "Section IV.B.5.a" or the "Other Insurance" clause.	Major	Build-It_BAP_CA0001.pdf	The specific policy provision mandating excess status.
8	Formats the output as a formal Coverage Position Letter.	Minor	Prompt Text	Style requirement.

5. Golden Response

RE: Coverage Position – Third-Party Property Damage Claim

1. Coverage Trigger & Symbol Identification

The vehicle involved in the accident, a rented truck, qualifies as a **Hired Auto** under **Symbol 8** of your Business Auto Policy (*Build-It_BAP_CA0001.pdf, Page 1*). Coverage is afforded for liability resulting from the use of autos you lease, hire, or borrow.

2. Priority of Coverage (Primary vs. Excess)

Per the **Other Insurance** condition in Section IV.B.5.a of the ISO CA 00 01 form, for any covered auto you do not own, the insurance provided by this policy is **excess** over any other collectible insurance (*Build-It_BAP_CA0001.pdf, Page 14*).

Furthermore, the **Rental Agreement** specifies that "Truck-Rent Co" provides the primary layer of coverage at the state minimum limit of **\$30,000** (*Rental_Agreement.pdf, Page 2*).

3. Loss Calculation & Allocation

- **Total Property Damage Loss:** \$400,000
- **Primary Coverage (Truck-Rent Co):** (\$30,000)

- **Net Excess Loss (Build-It Corp BAP): \$370,000**

As the remaining \$370,000 is within the policy's **\$1,000,000 Combined Single Limit**, Build-It Corp's BAP will pay the balance in full once the primary carrier's limits are confirmed as exhausted.
